

Week 2 — Thursday Lab: Delete & Reports

IM102 – Advanced Database Systems | 3 Hours | Computer Lab

Today's Goal

Build a proper delete flow and reports using GROUP BY.

Example: Delete Confirmation

```
// GET: show details and ask for confirmation
$product = $conn->query("
    SELECT p.*, c.name AS category
    FROM products p JOIN categories c ON p.category_id = c.id
    WHERE p.id = " . (int)$_GET['id']
)->fetch_assoc();
```

Display the product name, category, price, stock. Below, a form with a "Yes, Delete" button that POSTs to the same page. The POST handler runs `DELETE FROM products WHERE id = $id` and redirects.

Example: GROUP BY Report

```
SELECT c.name, COUNT(p.id) AS products,
       SUM(p.stock) AS total_stock,
       SUM(p.price * p.stock) AS total_value
FROM categories c
LEFT JOIN products p ON c.id = p.category_id
GROUP BY c.id, c.name
ORDER BY total_value DESC;
```

`LEFT JOIN` is important here — categories with zero products still show up (count = 0) instead of disappearing. `GROUP BY` collapses all rows per category into one summary row.

Your Turn

Build `delete.php` — show full product details, ask for confirmation, delete on POST, redirect. Cancel goes back without deleting.

Build `report.php` — a page with:

- Per-category breakdown (product count, total stock, total value, average price)
- Per-supplier breakdown (product count, total stock)
- Overall summary cards at the top

Add a "Delete" link to each row in `index.php` with a JavaScript confirmation as first guard.

Make sure your reports page has navigation back to the product list.
